All BV's quoted for Born 2013 are taken from DEERSelect May 2015.
Sire stag BV's are quoted from DEERSelect November 2014.
IOA (inches of antler) is a term now recognised as a measurement of live stags in hard antler, which is equivalent to the SCI scoring method.
Welcome,

We would like to offer you the opportunity to preview our line up of 2 year old Red Sire Stags on offer at our January 2016 sale.

We are confident you will be impressed with our continued progress in the stock we have on offer in this schedule.

We are excited by the number of quality 144/O/05 and Yesenin progeny we have to offer to the market this year as well as progeny by our exciting new young sires Churchill (Pure English W12BV +20) and Tui (European W12BV +28). I’m sure you’ll be impressed with the BV’s and weaning weights achieved in this crop.

We are comfortable we can provide you with a sire that will enhance your production whatever your goals may be (along with the antler structure the Easterns provide), endorsing all sires for growth rate.

If your looking to improve hind size, or if you are looking for a maternal or a stabilising line -144/O/05 or Churchill sons fit this description well, though some others may be strong in these traits on dam side.

You will notice a couple of hinds coming through a lot of the pedigrees this year in 350/96 and 350/94 and 34/03 – these hinds are proven dams for longevity and hardiness and have been foundation dams for our stud.

Good strategy is required both sides of the farm gate with the right implementation it will be rewarding if executed well, including performance enhancing genetics.

We look forward to seeing you at our sale or hope to hear from you in the near future if you have any queries or interest in our deer breeding program or feedback from past purchases.

We are proud to stand behind your investment into our genetics.

Michael Wilkins
Wilkins Farming Limited
Originally Sharrow Farm (now known as Wilkins Farming Ltd) supplied large numbers of hinds in the pioneering days of deer farming for corporations such as Eastern Deer Corporation in the Hawkes Bay and Land Corp throughout the South Island along with smaller Southland based operations.

Deer breeding has spanned over five decades now. Wilkins Farming has been breeding for body weight and velvet/trophy from various European bloodlines. Bloodlines bought from Rob Brookes in the 80’s and 90’s are based mainly on King Richard from Festl bloodlines Germany. These genetics have been carried on through the mid 90’s with Blue 13 who is a son of King Richard and also through Red 7, a grandson of King Richard.

King Richard was a recognised champion sire and was owned by Rob Brookes on his Ladyson farm in England. There seems to have been a universal agreement on the merit of this stag that has produced hard antler weights up to 14.2kgs with his body weight around 320kgs in his prime. King Richard’s temperament was outstanding.

These German genetics have been crossed with Hungarian bloodlines at Wilkins Farming with a son of Kapos called Fredrich, Fredrich’s velvet and body weights speak for themselves, and the progeny he left is certainly eye catching. He has been mated to selective hinds since being at Wilkins Farming, from various well-known bloodlines including German, Hungarian, Danish, Furzeland and Woburn & Warham.

Since 2001 artificial insemination (AI) has been a big part of introducing new genetics to our herd. These programs ranged in size starting with 50 hinds in 2001 to 800 in 2008. On the back of AI since 2004 we have been using embryo transfer (ET) to help speed up the multiplication of the animals, controlling breeding for specific traits. We have also breed and purchased top sires for venison growth and maternal traits. The quality of these sires is now the back bone of our breeding program and we rely less on AI and ET.

To continue our genetic and production improvement we purchased the Stanfield Eastern Stud in 2008. This stud was owned and managed by Clive and Elsie Jermy who pioneered the importation of Eastern European red deer to New Zealand.

For the second time we are also selling the progeny of the Doncaster herd we purchased three years ago. Peter and Yvonne Doncaster are well known Southland breeders who have a good following. Peters father Lindsay had put 32 years into breeding this stock which has added more depth to our breeding programme.

The introduction of this herd reiterates our commitment and depth of breeding within our herd. It is also a reflection of the dedication that spans over 5 decades from ourselves but the other breeders whose herds we have purchased. This enforces our goal of using the best genetics available and the use of the latest technology, including CT and ultrasound scanning.

Besides the recorded stock we have been continuously striving to breed European red deer for growth rate and trophy/velvet for large-scale commercial use.
Through recording it is easier to mate the right hind to the right stag for specific goals. We are continuously establishing and reviewing Breed values and DNA profiles of our animals to enhance the accuracy of our monitoring.

Our main focus is breeding an animal that will be an efficient breeder of venison. To do this you need to have the right genetics and feed.

Approximately 90% of our herd has a breeding focus on the following five principles:

1. A Red hind herd should have an average adult body weight of 110 to 120 kgs, creating satisfactory breeding efficiency.

2. Once this has been achieved you are on the front foot to getting this progeny to the high value early spring market. To achieve this market it is also important to select on the growth rate from weaning to 100kgs.

3. High carcass yield and high value meat cuts, breeding a higher value animal.

4. Temperament, fertility and calving date all play a part in having a successful breeding programme.

5. Strong velvet and trophy genetic base means these stags may still perform well beyond the venison market. The balance of our herd is still selected especially to breed trophy deer that are velveted until they reach their breeding potential. Then trophy value is realised, adding residual value to the sire when it comes to the end of its breeding worth.

In relation to point 3, we are currently in our tenth season of collecting on farm measurements of carcass loin for meat quality traits through ultrasound scanning, measuring eye muscle area of live deer. We are also making use of the Vio-scan services for meat yield at Invermay in Mosgiel, to add value to our breeding programme to further enhance carcass value.

We are using a wide range of genetics to achieve these goals, enabling us to have a large number of options for cross breeding. The genetics being sourced, we believe, are the best available in the world to our knowledge that we can access for the specific traits we are breeding for.

Wilkins Farming continue to keep pure bloodlines, alongside this our three main breeding groups consist of Euros (composite breed of deer from across UK and Europe), Eastern (Eastern European descent) and German English (German & English Parks). These three bloodlines are maintained through mating approximately 1500 fully recorded hinds annually. With this hind base we continue to collect data to evaluate the best options for breeding to optimise on farm production and profitability.
DEERSelect

DEERSelect provides genetic evaluations for the deer industry. Evaluations are completed 6 times a year using all information in all connected herds to estimate genetic merit for individuals.

Genetic merit of individuals is presented as:

- An estimated Breeding Value (eBV) describing an animal's merit for a given trait—eg Weaning weight or Weight at 12 months(kg)
- Or as an Index which consists of a number of relevant Breeding Values multiplied by economic weights that reflect the value of an extra unit of that trait to a production system. Indexes are expressed as dollars per hind fawning. A higher Index value represents a greater financial return.

Breeding Values

Breeding values are an estimate of the genetic merit of an individual for a trait relative to the average merit of all animals in the base year. For the deer industry the base year is 1995 and the genetic merit for that year is set as zero.

Breeding values are based on the performance of the individual and all known relatives.

Breeding values are corrected for environmental factors such as mob, age of dam, sex and differences between seasons. As more information is collected—later liveweights or the performance of progeny, the breeding values are updated. Breeding values are expressed in the same units as they are measured—so for growth (weight) and velvet they are in Kilograms and for conception date they are in days.

As the sire contributes half the DNA to his offspring and the other half comes from the dam, the expected progeny improvement $\frac{1}{2}$ the breeding value.

Eg. Liveweight at 12 months Breeding Value $W_{12eBV} = + 16kg$, so on average he will contribute +8kg genetically to his progenies liveweight at 12 months relative to an average sire in 1995. If high growth sires have been used for some time in a commercial herd, and replacement hinds retained, the genetic merit of the hind base will increase the rate of genetic gain in the progeny. Eg: +16kg Sire and +6kg hinds = +11kg liveweight at 12 months. Higher performance will require extra feed.

Indexes

Breeding values can be combined into an index which multiplies relevant breeding values by the value to a production system of a 1 unit increase in the trait. Indexes are expressed in cents/hind calving and a higher value indicates a greater overall value.

The Red Early-Kill Index consists of Growth, Meat and Conception date breeding values multiplied by relevant economic weights.

The Deer Terminal Index consists of Growth and Meat Breeding values and the relevant economic weightings.

Genetic gain is cumulative and provides a long-term improvement in productivity from your investment in animal genetics.
Figure 1. Genetic progress in 12-month weight Breeding Value across all DEERSelect herds over the last 20 years.
Success isn’t something you inherit.

Neville Jopson (AbacusBio)

Introduction

The main focus of genetic improvement programmes for venison production has been improving growth rates. High growth rate animals achieve slaughter live weights at an early age compared to low growth rate animals. While efficient conversion of grass into live weight is important in running an efficient venison operation, the weight of meat recovered from a carcass for sale is also very important. Heavier carcasses obviously have more meat than lighter carcasses, but that does not necessarily mean that the carcass has yielded well. Animals slaughtered at the same live weight can vary considerably in the weight of meat they produce.

For example, the difference in weight of meat in striploins measured at slaughter between the top and bottom 5% of a line of 95 Wilkins Farming red deer was 1.1kg after adjustment for differences in carcass weight. At $8/kg carcass weight, this equates to a difference of $9.80 per head from the loin alone, without including any related increase in meat yield from the other areas of the carcass. Including the weights of meat in the hindleg and shoulder cuts measured in the same trial slaughter resulted in a difference in value between the best and worst animals of $48 FOB/animal. This value is expected to increase as genetic improvement from the ultrasound and CT scanning programme add to the improvements in meat yield.

Ultrasound scanning

In order to estimate meat yield in a live animal, we have to be able to 'look inside' the body of the animal. Ultrasound scanning is a medical technology that is able to collect images of tissues in the body. It was developed for use on humans, but has been widely used in the sheep industry to measure the area of the eye muscle to improve meat production.

Ultrasound scanning works well for scanning farmed animals. The scanner itself is small and portable meaning it can be used on-farm. It does not take long to measure an individual animal and they can be measured in a crush without the need to sedate. It is also relatively inexpensive so a large number of animals can be measured. However, it is not possible to scan the entire carcass using ultrasound meaning that the results for the eye muscle are used to give an approximation of total meat yield. There are also problems with deer in collecting good images when the stags are in their winter coats.

Ultrasound is a useful tool in genetic improvement programmes for improving meat yield. It gives better estimates of meat yield than using live weight alone, but is not as accurate as more expensive technologies like CT scanning. However, the fact that it is inexpensive, easy to collect and can be measured on-farm means that potentially all young stags can be measured.

CT scanning

CT scanning is another human medical scanner that has been applied for use in livestock. CT scanner allows us to take very accurate measurements on meat and fat in the carcass of an animal. The CT measurements are effectively as accurate as slaughtering the animals and then dissecting out the meat from the fat and bone in the carcass. However, the stag is still alive after CT scanning and can be used in a breeding programme.

While the accuracy of CT is excellent, scanning is very expensive (hundred of dollars per
animal), and only a relatively small number of animals can be scanned in a day. The machine is not portable, so the deer have to trucked to the CT facility rather than scanned on farm. The deer also have to be anaesthetized while they are scanned. As such, it is suited to taking a set of highly accurate measurements on a small group of animals. This means that CT scanning is suited to selecting the stud sires for use in the stud rather than for animals for sale to clients. The genetic improvements made in the stud then flow on to the next crop of stags for sale.

Benefits of ultrasound and CT scanning

Selecting for growth rate alone will improve the value of an animal’s carcass because it will have a larger carcass at the same date, or it can be slaughtered at an earlier age. If some meat yield measurements (i.e. ultrasound and CT scanning) are included in the genetic improvement programme, it is possible to improve carcass yield over and above the improvement that comes from improved growth rate. In a breeding system that ultrasound scans all of the stags and CT scans the top 10% of stags, we would expect to lose a small amount of the improvement in growth rate (340g per round of selection), this would be compensated for by improvements in the yield of meat in the hind leg, loin and shoulder regions of the carcass. The gains have been estimated at an additional 510 grams of meat per round of selection, including 270g additional in the hind leg, 70g additional on the loin and 150 grams additional in the shoulder. These gains are per round of selection and are cumulative so with five years of selection the gains would be 1343, 373 and 747g more meat in the hindleg, loin and shoulder cuts than would have been the case if the stags had only been selected on the basis of growth rates.

These gains are based on random allocation of hinds to the stud stags. Further gains can be made using ‘assortative mating’ where the best stags are mated to the best hinds, although the level of inbreeding has to be monitored using this technology.
At PGG Wrightson we do our part each day in helping grow the country. We work with customers across New Zealand to source the right products and services. Our focus is on leading thinking to enable customers to concentrate on growing their business on a profitable and sustainable basis.

Special Conditions
No animals, embryos or semen sold by Wilkins Farming or their germplasm, any subsequent progeny or germplasm, including the semen and germplasm of that progeny may be supplied to any third party without the express written permission of Wilkins Farming Ltd.
The condition does not affect the normal commercial deer farming or stud farming, or the normal sales of semen or embryos as it applies to entities with the primary function of commercial semen/germplasm activity.

OSH
Every effort will be taken by the vendors, their staff and assistants, both on the day of the sale as well as on any other visits of inspection to ensure the safety of intending buyers and visitors. However we wish to advise that this is a farm run under normal management conditions and certain dangers exist in relation to livestock and their environment.
Visitors should take care to ensure their personal safety.
Although every care has been taken in compiling this catalogue to ensure accuracy no responsibility is accepted for any errors that may be included therein.

Conditions of Sale
1. The sale will be conducted by PGG Wrightson with the conditions of sale as set down by the Stock and Stations Agents Association, a copy of which is exhibited in the office on sale day.
2. Each lot becomes the purchaser’s property and risk at the fall of the hammer.
3. Warranties and Insurance are covered under separate headings.
4. Terms are strictly cash unless prior arrangements are made with the auctioneers. Accounts not paid within 14 days of sale shall bear interest, at current rate per annum from the date of sale.
5. The sale is conducted exclusive of GST.
6. A buyers commission of 4% is payable to non-participating companies and recognised independent agents introducing and accompanying purchasers to the sale providing prior arrangements [No later that 24hrs prior to sale] are made with PGG Wrightson.
7. Intending purchasers are required to register with the auctioneers prior to the commencement of the sale.
8. Antler will be cut after sale and remain property of vendor unless advised differently by purchaser on sale day.
9. All sale stags have passed Johnes testing.
10. Wilkins Farming Breeding Herds have been TB tested clear and carry C10 plus status.
11. Wilkins Farming will stand by their stag’s performance, though the vendor makes no guarantees.

SCHEDULE OF SIRES OF SALE STAGS

All Sires featured can be found on our website:
WWW.WILKINSFARMING.CO.NZ

Pictured:
Vladimir at 4 years
A massive English stag, the biggest (at 15 and 18 months) liveweights Stanfield have ever bred for this type of stag with outstanding breed values. Top all round new sire stag strong antler head estimated 4.5kgs velvet @ 2 years. Very quiet nature. W12eBV +20.05 (April 2015) W12 accuracy 92%! Currently No 1 (for English sires) on DEERSelect list!

- First crop of progeny born 2013 W12eBV’s up to 23.05.
Unbelievable antlered Eastern sire for age, showing the fabulous cross of Heinrich over Maximilian. At 5yrs a remarkable 56” wide, 47” long, 37¼” span, 12.5k.g. H/A and 469 SCI. This sire has the potential to hit 50” x 60” plus easy. His first crop of sons showed the same wide and heavy characteristics.

At 8 years he continued to produce a head of antler, he is renowned for main beam length of 49 inches, circumference of 11 inch mid beam, 43.5 inch inside span and 63 inch outside span.

Current BV W12 (currently under review).

No 1. EBV 2 year old at Stanfields 2006 stag sale with a huge head. This stag is one of the stars in 12 mth BV growth rate ranks. He was an amazing 262kgs at 2 years which at the time of purchase was quoted as a world record.

Super quiet and thick set stag with good deep body conformation as you can see here.

He has a large number of progeny (519) across a number of herds which gives us confidence in the accuracy of his current BV.

This stag has a current W12eBV of +17.6.

Megamilian
Sire of sale stags
Shown at 3 years • Eastern (Deceased)
This stag was retained from the 2011 sale line up to enable us to keep developing our antler structure in our Eastern herd. At three he grew a very impressive multi point head, 35 inch inside span.

His head is very wide with good length plus he has very good body weights and gives us other options being a Milan son. We are excited with the young progeny Milano has produced to date.

The stag was shown at 3 years in the Eastern line.
We purchased this stag as an outcross for us from the Peel Forest 2011 sire stag sale. He offers a lot of valuable traits, English German bloodline, W12eBV at purchase +14 and top velvet genetics to make a very attractive combo.

He is leaving some very solid high growth rate progeny.

A very promising Maximilian son, he was used the first time when this crop was mated.

He has sired 3 very nice looking Eastern sons that we are offering for sale in the catalogue.

A new and exciting sire to look out for in the future.

</tbody>
</table>

Sergei was a pure Romanian outcross to the Romany and Alexei lines. Taken as a trophy in 2007, 262 CIC points, the unofficial No. 5 ranked trophy for CIC.

His notable sons have sold to $37,000. However in January 2008 he produced two spectacular stags with the heaviest full antler sale heads recorded at the stud, 10.4 and 11.25kg and up to 250kg liveweight purchased by Jim Scourgie and John Carter.

This stags antler frame should never be under valued producing some very valuable and fine offspring, including a super good Sergei son Vladimir. Milan is also out of a Sergei daughter.
An exciting young stag by Corona who goes back to Alexei, the sire of Kabul. The dam WF 127/05 is a full sister to our sire 144/O/05 bred through one of our ET programs. The hinds in this pedigree have excellent performance and are second to none in our herd.

Tui’s pedigree contains top sires and is backed with the performance figures to be a top future sire.

Tui has an outstanding temperament we are very happy with his first crop of progeny that includes W12eBV’s up to 29.74.

- Tui has developed into a very well muscled sire who is No 2 on DEERSelect for composite deer with a W12eBV of 28.1. (November 2014)
Vladimir is the stag Clive Jeremy retained from his born 2005 Eastern crop. A son of Sergei by a Maximilian daughter, 253 kg live weight and 7.3 kg H/A stripped with a very heavy beam and top BV at the time for 12 mth growth rate of +17.71. This stag was a standout amongst stags that went onto sell for $27 000 and $28 000 per head respectably.

Antlers at 4 yrs where 42 “long and inside of 32”, as a velvet head he is very correct and cutting in excess of 9 kgs as a MA stag. He is incredibly quiet and a wonderful asset to have in the herd, he is leaving very high performing progeny and therefore proving to be a champion sire.

W12eBV 10.5 (Nov 2014).
Huge growth rates, two great sires Maximilian and Samurai to breed this stag. Out of one of our best dams for breeding efficiency 350 Red – well recognised for hardiness and longevity. Great body conformation and ranked No 1 on our loin and carcass value index for born 2005. We are continually impressed with his constitution through and after the roar.

144 is proving to be a standout sire. His progeny are eye catching and performing well in a number of traits including growth rate, yield, and hardiness (highly desirable on hill country). An ideal multi purpose sire for breeding replacement hinds (strong maternal traits) as well as high growth rates for venison production.

- Born 2013 progeny W12eBV’s up to 27.97. 144/O/05 has a current W12eBV of 20.3 (November 2014).
Good meaty looking stag. Top allround sire starting to prove his worth with good progeny coming through.

Good velvet head for age, and when grown out at 5 years, had a 24 point head.

Current (Nov 2014) W12BV 22.1 and proving to be a top lean carcass meat BV sire, as well as leaving solid looking sons.

• Born 2013 progeny W12eBV’s up to 29.81.
Nice all round pure German sire purchased from Foveran, good growth rates and velvet.

---

Excellent figures across the board about this Eastern stag - 170.5kgs at 15 months. By Max 33 out of a Discovery hind going back to Heinrich VI - this boy has serious potential.

---

One of two Max 33 sons offered this year. Excellent 15 month live weight and two wide heavy beamed sires featuring in the pedigree in Maximilian and Heinrich VI.

---

A full brother to one of our super sires Vladimir. Vladimir cut in excess of 9kgs of velvet as a MA stag. A lot to like about this stag including his bloodline.

Fantastic figures on this top ranking stag with all traits. No surprise when you look at his dam line and see 34/03 and 350/94 in pedigree, a full sister to 144. W12eBV would have to rank as one of the highest for this type of animal. 2nd biggest EMA area and ranked 4th for meat yield weight for age through CT scanning.

---

Nice stag here with solid figures. Very good W12eBV for a Vladimir son mated to a dam bred by proven sire 144/O/05.

Very quiet Vladimir son that has a strong German influence which makes this W12eBV outstanding for this type of animal. Good breeding efficacy of 60%. Good maternal potential here.

Megamilian over a Corona daughter (sire of Tui) top growth rate genetics.

While the focus has been on growth rate to 12 months, we have not ignored the residual value of a venison sire or one of our velveters may have through investment we have made in top all round stags.

From the photos shown on this page you can see where our up and coming trophy and velvet stags are heading and the potential these stags will have in the future.

Further to the development of our trophy and velvet genetics we are now breeding what we would consider as middle road stags achieving 400 SCI at 5 years which is very good for this age of stag. Though add to this at other extreme we have been breeding from a German/English cross stag named Infinity that scored 612 IOA at 5 years. So we are excited with Infinitys potential as he matures.

In 2009 we purchased the Eastern herd from Clive and Elsie Jermy’s Stanfield European Red Deer Stud. These continued to be sold under the Stanfield banner and facilities until 2011. The reason for purchasing this herd was the fact that it was the source herd for most of the high performing deer for venison production on Deer select originated from. This herd came with the added bonus that it is renowned for being the best source of Eastern European Red Deer genetics not only for body size but also velvet and antler performance.

After speaking to several people in the Trophy hunting circles we came to the conclusion that the hunters were after long, wide, clean heads which is what the Eastern are well known for.

The structure they can provide crossed with the multipoint English deer is hard to beat.

This coupled with the big frame and fast growth rates of the Eastern compliments what we are already achieving at Wilkins Farming through their other Red Deer genetics.

The potential shown with Trophy and Velvet can be seen by some stand out examples; Callum Patterson of Ida Valley has a Heinrich VI son cutting 11.7 kgs of Velvet at 5 years November 2011. Along with a number of industry greats for Antler - Slavonski, Lazslo, Sergei and Maximilian to name a few that have made their mark out of this herd.

SCHEDULE OF FUTURE SIRES

All Sires featured can be found on our website:
WWW.WILKINSFARMING.CO.NZ
This stag seems to have it all. Sired by Amadeus (Pure German) bred by Foveran which they described as “the most amazing 2 year old stag ever produced” out of a German/English Dam. This dam is sired by Steinlager bred by Black Forest and going back to Colin which is a Festl Park German Sire so in all 7/8 German/English.

His performance figures for this breed type in growth rate is rarely seen: 148 kgs at 15 months of age and sale day of 244 kgs at 2 years was the reason we made this purchase from breeders Eddie and Elliot Brock.

The added bonus in this sire was not only did he have super growth rates but the outstanding antler as you will see from the photos at 2 years of age, estimated to be +6 kgs of velvet.

We are looking forward to seeing the impact this stag will make in both our European and Maternal breeding programmes.
The star European stag for born 2011. Heaviest 11 mth weight at 146.6 kgs, equal heaviest Feb weight 188 kgs, impressive 12 mth EBV at +24.32 and in the top 5 for every other trait. This stag has huge potential to be new super sire like his sire 144-O-05.

Shown at 2 years • European
This stag again has great mix of growth rate 43 kgs weaning to 128 kgs at 15 months combined very wide stylish antler potential.

Bred by Foveran Deer Park sired by Image out of dam 7354/07 full sister to new master sire at Foveran Sebastian featuring Amadeus and Red Baron in her pedigree.

Another new sire to add to both our maternal and European breeding programmes.
New Woburn English blood for the Wilkins Farming maternal venison and velvet programmes. A twin son by the highly rated Bloomsbury. Dam 00/143 is also the dam of record 69 pointer and rising stars competition winner.

This stag has very thick, wide and correct velvet, but also had the second highest growth rate when comparing to other stags from the 2012 crop from weaning (37 kgs) to 15 month (128 kgs). Very impressive gain considering he was born and reared as a twin selected from Stanfields pure English sale 2015.

New Woburn English blood for Wilkins Farming venison breeding programme. The biggest Woburn bred at Stanfield for 15 month weight! 154.5 kg 14/02/2014
We are really looking forward to seeing the results of breeding this big Bloomsbury son with the likes of Churchill - the biggest Warnham bred at Stanfield for 15 month growth rate 168 kg.
We are lucky to own both of these stags. The mix of these two sires will give us an exciting opportunity to breed top allround velvet and growth rate English sires.
NOTE:
The deer have been bred between the two breeding units, Sharrow Downs, Wendonside and Harvey Road, Athol. All stock are amalgamated as weaners at Sharrow Downs until 2 years of age before being relocated on sale day to the Harvey Road, Athol property. This is due to the inability to display the complete sale line-up in the deer facility at Sharrow Downs.

DISTANCE
From Invercargill - Approx 110km • From Queenstown - Approx 78km
